

How to generate a file containing network-related information

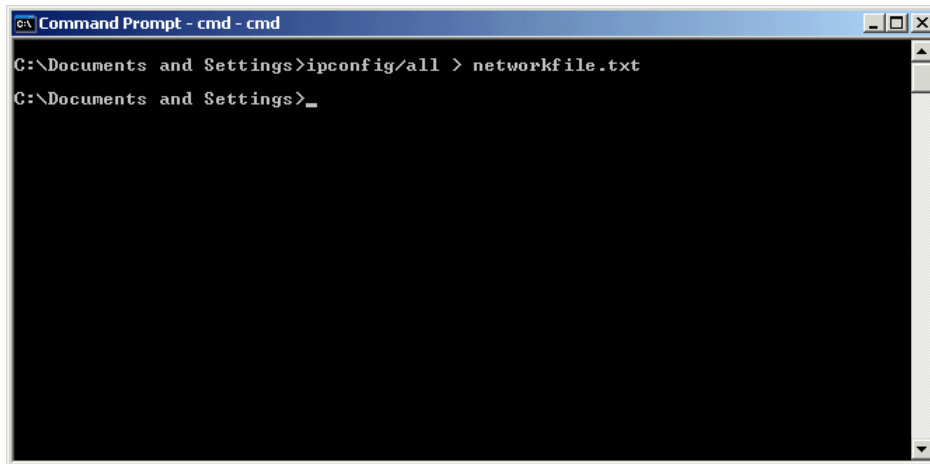

A license key is required in order to install and use NumericaTech software products. Network-related information such as MAC addresses of licensed user's computer is used to administer license. Please follow the procedure below to generate an ASCII file containing network-related information and upload the file. If you need further assistance, you contact webmaster@numericatech.com.

For Windows 2000/XP

Open Windows Command Prompt Window. Click **Start** and **Run**. Type **cmd** and then press **Enter**.

In the Command Prompt, type **ipconfig/all > networkinfo.txt**, and press **Enter**. This will create a file **networkinfo.txt** in the current directory. You can use any valid file name.

For Linux

In a terminal window, type **ifconfig -a > networkinfo.txt**, and press **Enter**. This will create a file **networkinfo.txt** in the current directory. You can use any valid file name. In typical Linux installation, the full path for ifconfig is **/sbin/ifconfig**.
